How does a wave-driven compressed air energy storage system work?

This paper proposes a novel wave-driven compressed air energy storage (W-CAES) system that combines a heaving buoy wave energy converter with compressed air energy storage. Wave drives the heaving buoy to convert the wave energy to mechanical work that pumps water into a water-air compression chamber to form a liquid piston compressor.

#### How much does isothermal deep ocean compressed air energy storage cost?

Herein,we introduce an innovative energy storage proposal based on isothermal air compression/decompression and storage of the compressed air in the deep sea. Isothermal deep ocean compressed air energy storage (IDO-CAES) is estimated to cost from 1500 to 3000 USD/kWfor installed capacity and 1 to 10 USD/kWh for energy storage.

Can a liquid piston based compressed air energy storage system improve utilization performance?

These gaps and challenges motivate researchers to investigate the potential of incorporating the liquid piston-based compressed air energy storage system with a hydraulic PTO system to enhance the utilization performance of a wave energy conversion system. This paper proposes a novel wave-driven compressed air energy storage (W-CAES) system.

What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) is an effective solution for balancing this mismatchand therefore is suitable for use in future electrical systems to achieve a high penetration of renewable energy generation.

How does wave condition affect energy storage power?

Energy storage power was almost proportional to the hydraulic cylinder area, with an upper limitbeing imposed by the wave condition. Nevertheless, the maximum storage pressure had an inverse relationship with the hydraulic cylinder area, which decreased energy density under the same wave condition.

### How does wave height affect energy storage power?

As the wave height increases, the wave energy increases and hence the energy storage power increases. However, as wave height is increased over the range investigated, the capture factor decreases from 9 % to 1 %. A significant decline in the capture factor was evident as the wave height escalated from 1 m to 2 m.
