The average lead battery made today contains more than 80% recycled materials, and almost all of the lead recovered in the recycling process is used to make new lead batteries. For energy storage applications the battery needs to have a long cycle life both in deep cycle and shallow cycle applications.

Li-S battery is one of the most promising candidates for next-generation energy storage technology. However, the rapid capacity fading and low-energy-density limit its large-scale applications. Scholars invest a lot of effort to introduce new materials. A neglected problem is that reasonable structure is as important as new material. In this review, four kinds of ...

Lithium ion batteries (LIBs), as one of the most important energy storage technologies, have been playing a key role in promoting the rapid development of portable electronic devices as well as electric vehicles [1], [2], [3].The continually increasing application demands have stimulated the development of LIBs with impressive energy and power density, ...

Li et al. employed ZnO as the shell material and n-eicosane as the core material to synthesize multifunctional microcapsules with latent heat storage and photocatalytic and antibacterial properties . The thermal performance of the microcapsules depends on the ratio of n -eicosane to $Zn(CH \ 3 \ COO) \ 22 \ H \ 2 \ O$.

The cylindrical lithium-ion battery has been widely used in 3C, xEVs, and energy storage applications and its safety sits as one of the primary barriers in the further development of its application.

The value of nominal battery voltage (V Bat, no min al) can be determined by the following relation [75], (3) V Bat, no min al = E C n C n where E C n is the energy value known as rated energy storage capacity expressed in kilowatt-hours (kWh). Both nominal capacity and rated energy storage capacity are usually related to the beginning of life ...
