However, the stored energy can be released at higher temperatures, allowing for higher process efficiency in the thermodynamic cycle for energy generation, and is retained in a more stable form, suitable also for seasonal energy storage. Using a bed of only limestone may produce better results, as the density of energy storage is only slightly ...

Packed bed storage units usually have two (or more) openings, one in the upper part and one in the lower part of the storage bed, to promote thermal stratification. In operation, solar energy is supplied to the storage bed (charging) by hot air from the SAHs, increasing the temperature of the rocks.

The beds can also be used for storing thermal energy (TES) and offer a rapid and effective way to exploit solar energy especially for heating applications. Microencapsulated PCMs serve as the TES medium and the fluid phase in these applications. There exist few experimental studies that have investigated uses of fluidized beds for thermal storage.
