BIDIRECTIONAL DC-DC CONVERTERS Most of the existing BDCs are characterized by a current fed or voltage fed on one side [14]-[18]. Based on the placement of an auxiliary energy storage, BDCs can be categorized into buck and boost type. In the buck type, energy storage is placed on the high voltage side and in the boost type on the low voltage side.

The energy storage device improves the system resiliency by absorbing excess energy during periods of surplus energy generation or injecting it into the load during periods of insufficient energy [8], [9]. The bidirectional converter controls both charging and discharging of the storage device, by transferring the energy between the WECS and ...

The bidirectional configuration-based converters act as interfacing element between energy storage devices and power sources which shrink the size of the converter and enhance the performance of the overall system because the requirement of two individual converters is not required to perform the forward and reverse directions of power flow.

Description. The Bidirectional DC-DC Converter block represents a converter that steps up or steps down DC voltage from either side of the converter to the other as driven by an attached controller and gate-signal generator. Bidirectional DC-DC converters are useful for switching between energy storage and use, for example, in electric vehicles.

Energy storage systems (ESSs) refer to equipment that can store and release energy stably in a safe manner [1]. Due to the complementary characteristics of different ESS devices in terms of power and energy density, life cycle, response rate, etc., hybrid ESSs become state-of-the-art power sources recently [2] binning the advantages of a single energy ...
