What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) is an effective solution for balancing this mismatchand therefore is suitable for use in future electrical systems to achieve a high penetration of renewable energy generation.

Where is compressed air energy storage most likely to be used?

North Americaand Sub-Saharan Africa have the highest shares globally. Northeast and Southeast Asia have the least potential for compressed air storage. This paper presents the geological resource potential of the compressed air energy storage (CAES) technology worldwide by overlaying suitable geological formations, salt deposits and aquifers.

Which geological Site is suitable for compressed air energy storage?

A suitable geological site for compressed air energy storage is given by a highly permeable porous formationand a tight cap rock to prevent the buoyant rise of the air (see Fig. 1). In northern Germany, anticline structures suitable for CAES can be found in a variety of settings (Baldschuhn et al. 2001).

What is a compressed air energy storage process?

Illustration of a compressed air energy storage process. CAES technology is based on the principle of traditional gas t urbine plants. As shown in Figu re gas turbine, compressor and combustor. Gas with high temperature and high pressure, which is turn drives a generator to generate electricity [20,21]. For a CAES plant, as shown in Figure 5, there

Where is compressed air stored?

Compressed air is stored in underground caverns or up ground vessels,. The CAES technology has existed for more than four decades. However, only Germany (Huntorf CAES plant) and the United States (McIntosh CAES plant) operate full-scale CAES systems, which are conventional CAES systems that use fuel in operation,.

What are the main components of a compressed air system?

The largest component in such systems is the storage medium for the compressed air. This means that higher pressure storage enables reduced volume and higher energy density.

More on Compressed Air Energy Storage History of Compressed Air Energy Storage. CAES was originally established at a plant in Huntorf, Germany in 1978. The plant is still operational today, and has a capacity of 290 MW. The compressed air is stored in underground in retired salt mines and used to supplement the energy grid during peak usage.
