

What is the future of energy storage?

"The Future of Energy Storage," a new multidisciplinary report from the MIT Energy Initiative (MITEI), urges government investment in sophisticated analytical tools for planning, operation, and regulation of electricity systems in order to deploy and use storage efficiently.

Can long-duration energy storage transform energy systems?

In a new paper published in Nature Energy, Sepulveda, Mallapragada, and colleagues from MIT and Princeton University offer a comprehensive cost and performance evaluation of the role of long-duration energy storage (LDES) technologies in transforming energy systems.

Why is energy storage important?

As the report details, energy storage is a key component in making renewable energy sources, like wind and solar, financially and logistically viable at the scales needed to decarbonize our power grid and combat climate change.

Can low-cost long-duration energy storage make a big impact?

Exploring different scenarios and variables in the storage design space, researchers find the parameter combinations for innovative, low-cost long-duration energy storage to potentially make a large impact in a more affordable and reliable energy transition.

How will storage technology affect electricity systems?

Because storage technologies will have the ability to substitute for or complement essentially all other elements of a power system, including generation, transmission, and demand response, these tools will be critical to electricity system designers, operators, and regulators in the future.

Does energy storage capacity cost matter?

In optimizing an energy system where LDES technology functions as "an economically attractive contributor to a lower-cost, carbon-free grid," says Jenkins, the researchers found that the parameter that matters the most is energy storage capacity cost.

Energy storage is currently a key focus of the energy debate. In Germany, in particular, the increasing share of power generation from intermittent renewables within the grid requires solutions for dealing with surpluses and shortfalls at various temporal scales. Covering these requirements with the traditional centralised power plants and imports and exports will ...
