What is active cell balancing?

Active cell balancing (i.e.,transferring charge among cells) can equalize their charge levels,thereby increasing the battery pack's usable capacity. But performing balancing means additional charge transfer,which can result in energy loss and cell aging, akin to memory aging in storage technologies due to writing.

How does active cell balancing affect battery capacity?

This reduces the usable capacity of the battery - the charge levels of one or more cells might be at the minimum threshold while most of the other cells have residual charge. Active cell balancing (i.e.,transferring charge among cells) can equalize their charge levels, thereby increasing the battery pack's usable capacity.

Can passive and active cell balancing improve EV battery range?

Consequently, the authors review the passive and active cell balancing method based on voltage and SoC as a balancing criterion to determine which technique can be used to reduce the inconsistencies among cells in the battery pack to enhance the usable capacity thus driving range of the EVs.

How does cell imbalance affect the performance of a battery energy storage system?

The performance of a battery energy storage system is highly affected by cell imbalance. Capacity degradation for an individual cell which leads to non-utilization for the available capacity of a BESS is the main drawback of cell imbalance.

What is the difference between active and passive balancing?

Passive balancing methods uses resistance to dissipate excess energy from the over charged cells of battery pack whereas in active balancing method the excess energy is transferred to other cell (s) rather than the dissipation of it.

Does passive cell balancing reduce energy dissipation?

Passive cell balancing led to energy dissipation f the cells which have higher SoC to make all the cells have the same level of SoC as the lowest cell, i.e. cell C (65%). Accordingly, the system efficiency will be reduced.

Based on the different energy storage characteristics of inductors and capacitors, this study innovatively proposes an integrated active balancing method for series-parallel battery packs based on inductor and capacitor energy storage. The balancing energy can be transferred between any cells in the series-parallel battery pack.

By using this process, the service life and available capacity are prolonged. But there is a downside, as the time taken to charge is longer, plus there is a small amount of energy loss, due to the heat generated by the resistors being used. The problem of energy loss can be resolved by using active balancing.
