Currently, the ongoing progress in pulsed power systems necessitates the development of energy storage components with improved performance and reliability [[1], [2], [3]].Lead-free dielectric ceramic capacitors, as the most promising alternative to Pb-based capacitors, have attracted widespread attention on account of their advantages such as ...

Energy-storage efficiency is energy storage capacity combined with energy density[6]. The hysteretic loss is the main reason of low energy-storage efficiency, which arises due to the inertia resistance from the inelastic movement of particles. Typically polymers has larger dielectric loss than ceramics[7]. Clearly developing materials with high

Electrostatic capacitors are among the most important components in electrical equipment and electronic devices, and they have received increasing attention over the last two decades, especially in the fields of new energy vehicles (NEVs), advanced propulsion weapons, renewable energy storage, high-voltage transmission, and medical defibrillators, as shown in ...

The test results show that PI fibers can greatly increase the high-temperature breakdown strength and thus improve the high-temperature energy storage performance of the composite dielectric. 5 vol% PI@PEI composite has the best energy storage characteristics, but its high-temperature energy storage efficiency is relatively low.

Among currently available energy storage (ES) devices, dielectric capacitors are optimal systems owing to their having the highest power density, high operating voltages, and a long lifetime. Standard high-performance ferroelectric-based ES devices are formed of complex-composition perovskites and require precision, high-temperature thin-film fabrication. The discovery of ...

The power-energy performance of different energy storage devices is usually visualized by the Ragone plot of (gravimetric or volumetric) power density versus energy density [12], [13]. Typical energy storage devices are represented by the Ragone plot in Fig. 1 a, which is widely used for benchmarking and comparison of their energy storage capability.
