

Niyas et al. [137] experimentally tested the performance of a lab-scale latent TES prototype, which used finned tubes and had a heat storage capacity of 2.78 kWh. The heat transfer during the melting process was controlled by natural convection meanwhile the heat transfer regime during the solidification process was mainly controlled by conduction.

This article first characterizes the thermal properties of RFs. Results show a specific heat capacity of 0.67-0.97 kJ/(kg \cdot $^{\circ}$ C) within 20-380 $^{\circ}$ C, with stable thermal properties from 100 to 1000 $^{\circ}$ C. Then, the heat transfer performance of RFs and heat transfer oil (HTO) in a shell and tube heat exchanger is experimentally investigated.

Solid-state hydrogen storage technology using metal hydrides as carriers has great application prospects. storage type or regenerative heat exchanger is shown in Figure 14.6. In this heat exchanger energy is stored periodically. Medium is heated or cooled alternatively. The heating period and cooling period constitute 1 (one) cycle.

This study experimentally investigates the using of a triplex tube heat exchanger (TTHX) with PCM in the middle tube as the thermal energy storage to power a liquid desiccant air-conditioning system.

The concrete block heat storage system integrates heat exchange tubes permanently embedded within the concrete blocks, enabling the HTF to exchange heat with the concrete. However, concrete is susceptible to cracking during charge/discharge cycles [20], thereby impacting system operation, and its maximum operating temperature of 400-450 °C ...

Compared with sensible heat energy storage, latent heat thermal energy storage system (LHTES) has higher energy storage density. However, the low thermal conductivity of PCM is a major obstacle to achieving more efficient LHTES technology. Therefore, this study uses numerical simulation to evaluate the effectiveness of five enhanced heat transfer methods for LHTESs, ...
