

Energy storage investment prospects

What do we expect in the energy storage industry this year?

This report highlights the most noteworthy developments we expect in the energy storage industry this year.

Prices: Both lithium-ion battery pack and energy storage system prices are expected to fall again in 2024.

How does energy storage affect investment?

The influence of energy storage on investment is contingent upon various factors such as the cost of storage technologies, the availability of government incentives, the design of market mechanisms, the share of generation sources, the infrastructure, economic conditions, and the existence of different flexibility options.

Are high energy storage prices a signal for future investment?

Geske and Green (2020) stated that high prices are a signal for new production investments and the impacts of storage facilities on market prices may create a negative signal for future investments. On the other side, the expansion of energy storage investments results in a decrease in storage investment costs due to the learning effect.

Will energy storage grow in 2023?

Global energy storage's record additions in 2023 will be followed by a 27% compound annual growth rate to 2030, with annual additions reaching 110GW/372GWh, or 2.6 times expected 2023 gigawatt installations. Targets and subsidies are translating into project development and power market reforms that favor energy storage.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

What drives energy storage investment?

Much of the growth in energy storage investment is being driven by mandates and targeted subsidies, ranging from solar and wind co-location mandates in China, to the Inflation Reduction Act and state-level policies in the US. New support schemes are also emerging across Europe, Australia, Japan, South Korea, and Latin America.

Long duration energy storage typically can dispatch power for 10 to 12 hours, making it well-suited to complement the day-to-night intermittency of solar generation. A study by the Cleantech Group showed that investments in long-duration energy storage (LDES) has grown sharply to \$1.8 billion last year, as seen below.

The cost invested in the storage of energy can be levied off in many ways such as (1) by charging consumers for energy consumed; (2) increased profit from more energy produced; (3) income increased by improved assistance; (4) reduced charge of demand; (5) control over losses, and (6) more revenue to be collected from renewable sources of energy ...
