Sodium-ion is one technology to watch. To be sure, sodium-ion batteries are still behind lithium-ion batteries in some important respects. Sodium-ion batteries have lower cycle life (2,000-4,000 versus 4,000-8,000 for lithium) and lower energy density (120-160 watt-hours per kilogram versus 170-190 watt-hours per kilogram for LFP).

Commonly used ESS includes battery energy storage systems, with most demandable batteries being rechargeable lithium batteries. What Are The Different Types Of Energy Storage Systems? ... A lithium-ion energy storage system cost per kWh typically ranges from \$150 to \$200. An average-sized residential battery system will range from \$1300 to ...

Lithium metal batteries use metallic lithium as the anode instead of lithium metal oxide, and titanium disulfide as the cathode. Due to the vulnerability to formation of dendrites at the anode, which can lead to the damage of the separator leading to internal short-circuit, the Li metal battery technology is not mature enough for large-scale manufacture (Hossain et al., 2020).
