But as it turns out, DIY solar can mean something more than just installing your own solar panels -- it can mean building your solar panels from scratch.

Can you build your own solar panels?

Yes-- it is possible to build your own solar panels from scratch. It may be challenging to replicate the caliber of a solar manufacturer that has years of research and experience behind it, but it can still be done. Is It Cheaper to Build Your Own Solar Panels?

How do you make a solar panel?

Choose and cut your board in such a way that you have longer and fewer rows (e.g., four rows, each with 12 cells). You'll use tabbing wire to connect the solar cells in each of your rows together. Solar cells have several tiny lines running lengthwise and two thicker lines (contact pads) running across their width.

What are thin-film solar panels?

Thin-film solar panels are different from those panels made out of crystalline silicon. Thin-film panels are made by applying a very thin layer of photovoltaic material on a substrate, like glass, metal, or plastic. Thin-film solar panels are the least efficient out of all three, but have a uniform appearance.

Is DIY solar a good idea?

But as it turns out, DIY solar can mean something more than just installing your own solar panels -- it can mean building your solar panels from scratch. While not too common, if you have a knack for major DIY assembly projects, you may want to make your own solar panel components yourself.

How do you attach solar cells to a solar panel?

Bus Wire: Thicker wire for connecting rows of solar cells. Substrate Material: Plywood or a plastic sheet, cut to the size of your solar panel. Non-Conductive Glue: For attaching cells to the backing. Plexiglass or EVA Film: To cover and protect the solar cells. Silicone Caulk: To seal the edges and prevent moisture entry.
