

PDF | On Oct 1, 2023, A.V. Fedyukhin and others published Hydrogen application in the fuel cycle of compressed air energy storage | Find, read and cite all the research you need on ResearchGate

Therefore, the generated renewable energy needs to be stored in a reliable form, which should be tolerant to the fluctuation and randomness of those renewable energy sources. There are several existing energy storage options, e.g., pumped hydro energy storage, compressed air energy storage, batteries, etc. [63]. Compared with them, hydrogen has ...

This paper introduces, describes, and compares the energy storage technologies of Compressed Air Energy Storage (CAES) and Liquid Air Energy Storage (LAES). Given the significant transformation the power industry has witnessed in the past decade, a noticeable lack of novel energy storage technologies spanning various power levels has emerged. To bridge ...

We present analyses of three families of compressed air energy storage (CAES) systems: conventional CAES, in which the heat released during air compression is not stored and natural gas is combusted to provide heat during discharge; adiabatic CAES, in which the compression heat is stored; and CAES in which the compression heat is used to assist water electrolysis for ...

The combined compressed gaseous hydrogen and compressed air storage chamber is thermodynamically assessed based on energy and exergy calculations. In order to perform a proper thermodynamic analysis, the state points in ...

1. Introduction. The production and consumption of hydrogen in Russia exceeds 5 million tons per year (almost 2/3 of hydrogen is for the production of ammonia and methanol, oil refineries are another major player), mainly its production is for the own needs of enterprises (the free hydrogen market is only about 160 thousand tons, more than 70% falls on the Volga ...

As renewable energy production is intermittent, its application creates uncertainty in the level of supply. As a result, integrating an energy storage system (ESS) into renewable energy systems could be an effective strategy to provide energy systems with economic, technical, and environmental benefits. Compressed Air Energy Storage (CAES) has ...

Two main advantages of CAES are its ability to provide grid-scale energy storage and its utilization of compressed air, which yields a low environmental burden, being neither toxic nor flammable.

This conversion offers higher energy density than pumped storage and compressed air storage, allowing for more flexible deployment and storage and enabling a broader range of applications. ... UHS is a promising

technology for large-scale hydrogen energy storage, but it faces several challenges. The economic viability of UHS is hindered by high ...

eous hydrogen storage method is widely employed. With high-pressure characteristics of hydrogen storage, rigorous safety precautions are required, such as filling of compressed gas in a hydrogen tank to achieve reliable operational solutions. Kim et al. [3] analyzed hydrogen fill-ing for a 175-liter tank used in large-sized hydrogen vehicles.

Abstract Hydrogen is an ideal energy carrier in future applications due to clean byproducts and high efficiency. However, many challenges remain in the application of hydrogen, including hydrogen production, delivery, storage and conversion. In terms of hydrogen storage, two compression modes (mechanical and non-mechanical compressors) are generally used to ...

Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distribution centers. In response to demand, the stored energy can be discharged by expanding the stored air with a turboexpander generator.

Many energy storage methods such as thermal energy storage (Dong et al., 2011; Wang et al., 2008), electrical batteries (Daud et al., 2016), hydrogen energy storage (HES) (Sun & Sun, 2020), pumped hydro energy storage (PHES) (Hosseini & Semsar, 2016), and compressed air energy storage (CAES) (Assareh & Ghafouri, 2023; Tayefeh, 2022) have been ...

8 Large-scale storage of hydrogen needed for utility-scale power generation. Scheme of the CAHES system concept, HG e Hydrogen Generator, MU -Methanation Unit, HX -Heat Exchanger, H₂ eC e Hydrogen Compressor, O₂ eC e Oxygen Compressor, CO₂ eC e Carbon Dioxide Compressor ...

Erdemir et al. [15] proposed a new CAES system combined with a hydrogen storage device, which has a two-chamber storage system with air and hydrogen stored in two separate chambers. The two chambers work in a synchronous manner, with one being compressed and the other being expanded to achieve constant pressure operation for both ...
