

Leakage current in solar AC power generation system

How to eliminate leakage current in solar PV array system?

There are two distinct methods to eliminate the leakage current in the solar PV array system: (i) obstruct the leakage current, (ii) reduce the variation/constant common-mode voltage. The additional diodes/switches are incorporated in the system to obstruct the leakage current by disconnecting the PV array from the grid side network.

How does leakage current affect a grid?

The leakage current circulates through the physical earth of the grid and parasitic capacitances of each pole of the panel, as illustrated in Figure 3. This current impairs the functioning of the system, injecting harmonics into the grid and produces risks to human health.

How to obstruct a leakage current?

The additional diodes/switches are incorporated in the system to obstruct the leakage current by disconnecting the PV array from the grid side network. The second approach involves the elimination of zero switching states. To address the aforementioned issues, the transformerless SECS is presented in .

How to reduce leakage current in a current-source inverter?

Furthermore, another commonly used strategy is the disconnection of the AC side and the PV during free wheeling times of inductors in current-source inverters. Finally, it was highlighted that the modulation strategy is a critical factor in reducing the leakage current.

Does common-mode voltage affect the leakage current of a photovoltaic inverter?

Therefore, by the manipulation of the modulation technique, is accomplished a decrease in the leakage current. However, the connection standards for photovoltaic inverters establish a maximum total harmonic distortion of 5%. In this paper an analysis of the common-mode voltage and its influence on the value of the leakage current is described.

What are the problems of leakage current?

The leakage current depends mainly on the topology and the modulation strategy used. The main problems are--an increase in losses, current harmonics, safety issues, and interference problems of electromagnetic effect [23]. These problems have been reported in different papers [24, 25, 26, 27].

AC Leakage Current. AC (alternating current) leakage occurs when there is an unintended flow of electric current along paths other than the intended circuit. This type of leakage is prevalent in AC-powered electrical systems, commonly found in homes, offices, and industrial settings. AC leakage can be caused by various factors, including:

The distributed photovoltaic (PV) power generation aids in meeting the peak electric energy demand and environmental concerns [1]. In addition, transmission line losses are reduced due to localised power generation. A power electronic (PE) inverter is required to interface the PV source with the grid. The non-isolated inverter has been widely used in photovoltaic generation applications due to its low cost, reduced size, low weight, and high efficiency. However, when there is no galvanic isolation between the photovoltaic (PV) plant and the grid, leakage current may be generated due to the parasitic capacitor to the ground of the photovoltaic (PV) plant, ...

Photovoltaic (PV) transformer-less single-phase inverters are widely used in the solar generation systems because of low cost, high power density, and high efficiency.

The proposed topology offers low loss ac side decoupling, complete elimination of leakage current via CMV clamping and reactive power generation capability. The proposed modulation technique facilitates the flow of current in order to generate zero voltage state during negative power flow.

Figure 5 depicts the system with fault (LG, LLG, LLLG) in the AC side/Grid system, the current difference calculated at the DC cables will intend to change. Depending on the type of the fault the difference may vary since the circulating currents from faults may affect the system [], for every fault and fault impedances the differences may not be equal to each other.

This paper proposes, the passive filter is designed herein for the solar PV array system to suppress the leakage current. The frequency-domain analysis of the system is performed herein to carry out the optimum filter parameters. In this design approach, there is not any need for additional semiconductor switches, unlike the state-of-art systems.
