Are lithium-ion batteries a viable energy storage solution?

Lithium-ion batteries (LIBs) have become one of the main energy storage solutions in modern society. The application fields and market share of LIBs have increased rapidly and continue to show a steady rising trend. The research on LIB materials has scored tremendous achievements.

Why are lithium-ion batteries used in electrochemical energy storage technology?

It is well known that lithium-ion batteries (LIBs) are widely used in electrochemical energy storage technology due to their excellent electrochemical performance. As the LIBs energy density is becoming more and more demanding, the potential electrode material failure and external induced risks also increase.

How to improve the production technology of lithium ion batteries?

However, there are still key obstacles that must be overcome in order to further improve the production technology of LIBs, such as reducing production energy consumption and the cost of raw materials, improving energy density, and increasing the lifespan of batteries.

What are thin-film lithium-ion batteries (LIBs)?

One of the current cutting-edge energy storage technologies is the use of thin-film lithium-ion batteries (LIBs).

How much energy does a lithium secondary battery store?

Lithium secondary batteries store 150-250 watt-hours per kilogram (kg) and can store 1.5-2 times more energy than Na-S batteries, two to three times more than redox flow batteries, and about five times more than lead storage batteries. Charge and discharge efficiency is a performance scale that can be used to assess battery efficiency.
