Why is paraffin wax a good organic material for phase change energy storage?

In addition, due to high latent heat, chemical inertness, effective thermal stability, easy availability, and low price, paraffin wax is a good organic material for phase change energy storage. Chemically, paraffin wax is inert because there are no functional groups or free electrons.

Do phase change materials improve energy storage and thermal management?

Nature Energy 7, 270-280 (2022) Cite this article Phase change materials show promise to address challenges in thermal energy storage and thermal management. Yet, their energy density and power density decrease as the transient melt front moves away from the heat source.

Can paraffin improve thermal conductivity of microcapsule phase change materials?

Advanced thermal management systems realized through the design and manufacture of paraffin-based phase change materials have been widely used in various fields. Therefore, improving the thermal conductivity of microcapsule phase change materials with paraffin as the core material has become a research focus in recent years.

How to improve thermal conductivity of microcapsule composite phase change material?

Adding high thermal conductivity materials such as carbon-based particles and metal nanoparticles to the microcapsule composite phase change material can increase the overall thermal conductivity of the composite material. It is important to improve the heat storage performance of the microcapsule composite phase change material.

What are thermal control microcapsule phase change materials?

Feng et al. prepared thermal control microcapsule phase change materials with paraffin wax and urea-formaldehyde resins as the core and wall materials respectively, and used them in cement slurry with a low heat of hydration, which effectively avoided the decomposition of natural gas hydrate.

What are microcapsule phase change materials?

Li et al. prepared microcapsule phase change materials with urea-formaldehyde resins as the wall material, paraffin wax as the core material, and a small amount of modified carbon nanotubes (CNTs) in the core material by in-situ polymerization.
