

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ( $< 10 \text{ W/(m} \cdot \text{K)}$ ) limits the power density and overall storage efficiency.

What are the different types of thermal energy storage systems?

Thermal energy storage (TES) systems store heat or cold for later use and are classified into sensible heat storage, latent heat storage, and thermochemical heat storage. Sensible heat storage systems raise the temperature of a material to store heat. Latent heat storage systems use PCMs to store heat through melting or solidifying.

Are HNePCMs effective thermal energy storage materials?

Thus, HNePCMs are demonstrated to be more efficient materials and are emerging as potential materials to augment the performance of TES applications. The authors declare no conflict of interest. The disparity between the supply and demand for thermal energy has encouraged scientists to develop effective thermal energy storage (TES) technologies.

The article presents different methods of thermal energy storage including sensible heat storage, latent heat storage and thermochemical energy storage, focusing mainly on phase change materials (PCMs) as a form of suitable solution for energy utilisation to fill the gap between demand and supply to improve the energy efficiency of a system.

What is thermal energy storage?

Thermal energy storage: Thermal energy storage systems are one of the most commonly practiced forms of energy storage. These storage systems store energy in the form of latent heat,  $Q_s$ , or sorption heat. The process of storage and the materials used will be discussed in detail in this paper.

How can thermal energy storage contribute to more appropriate thermal energy production-consumption?

Hence, thermal energy storage (TES) methods can contribute to more appropriate thermal energy production-consumption through bridging the heat demand-supply gap.
