However, if PEG is combined with wood as a phase change material, there are also the following disadvantages: (1) wood as a porous structure cannot prevent the leakage of PEG at high temperature; (2) there is poor heat exchange performance of PEG for the low thermal conductivity, which will affect the efficiency of energy storage and energy ...

Among these, the storage or release of thermal energy using the latent heat storage of phase change materials (PCMs) has emerged as a promising option for reducing the heating and cooling loads and shifting the peak loads of buildings in the past few decades [8]. Because PCMs have a substantial latent heat, TES employing them improves a ...

Thermal energy harvesting and its applications significantly rely on thermal energy storage (TES) materials. Critical factors include the material's ability to store and release heat with minimal temperature differences, the range of temperatures covered, and repetitive sensitivity. The short duration of heat storage limits the effectiveness of TES. Phase change ...
