

Can diamond wire sawing be used for photovoltaic silicon wafers?

This paper reviews recent research on diamond wire sawing of photovoltaic silicon wafers and compares it with the loose abrasive wire sawing process from a standpoint of sustainable manufacturing.

How is diamond wire made?

Wire manufacturing The diamond wire is produced by coating high carbon steel wires with electroplated nickel, which binds the 8-12 μm sized diamond abrasives to the steel core wire [14,36,84]. The process has undergone improvements over the years.

Does diamond wire break-in affect process performance?

Other related work showed the diamond wire break-in during initiation of cutting, which impacts the process performance. Prediction of diamond wire wear along with total thickness variation, and lifetime estimation, has also been reported.

Is there a correlation between diamond wire wear and RV frequency?

A correlation exists between the percentage of diamond wire wear and the shift in RV frequency (see Fig. 16). The RV method is able to detect internal flaws below the surface of the diamond wire components (core, metal layers, etc.) and is compatible with the harsh wafering environment.

What are the limitations of diamond wire slicing technology?

The limitation for reducing the wire core with slurry-slicing technology is around 110mm; however, with diamond-wire-slicing technology the wire core can be reduced further. The diamond wire core used today is around 100mm, with the trend moving to less than 70mm within the next two years.

How abrasive properties affect diamond wire sawing?

Effect of abrasive properties Abrasive parameters affect both loose abrasive slurry and fixed abrasive diamond wire sawing because they impact the micro-mechanical interaction between the abrasives and silicon during cutting.

2.2 Wafer Chamfers and Rounded Edges. The outer edge of the wafer cut by the wire cutting or inner circular cutting saw blade is very sharp. In order to avoid the edge cracking affecting the wafer strength, destroying the surface smoothness and causing pollution to the subsequent process, It must be automatically trimmed the edge, shape and outer diameter ...

As a typical hard brittle material, silicon is particularly sensitive to the distribution and change of stress. Cheng et al. [10] studied the sawing stress in the process of sawing large-size mc-Si brick with diamond wire saw, and considered that the sawing stress mainly includes two parts: mechanical stress and thermal stress. The sawing stress is the result of the coupling ...

DOI: 10.1016/J.SOLENER.2021.01.009 Corpus ID: 233819259; Analysis of crack-free surface generation of photovoltaic polysilicon wafer cut by diamond wire saw @article{Yin2021AnalysisOC, title={Analysis of crack-free surface generation of photovoltaic polysilicon wafer cut by diamond wire saw}, author={Youkang Yin and Yufei Gao and Liyuan ...

Monocrystalline silicon is an important material for processing electronic and photovoltaic devices. The fixed diamond wire sawing technology is the first key technology for monocrystalline ...

Fracture strength of photovoltaic silicon wafers cut by diamond wire saw based on half-penny crack system. 2021, Engineering Fracture Mechanics. ... Compared with electroplated diamond wire, resin-bonded diamond wire has a more uniform distribution of protrusion height, which leads to less crack damage, and therefore ensures further thinning of ...

Summary This chapter presents various aspects of diamond-impregnated wire saws, including the design and manufacturing of diamond wires, the slicing mechanism, ... The properties include wafer surface, fracture strength, residual stress, PV wafer efficiency, and cost of wafering. References., - ...

1 Wuhan University of Science and Technology, Wuhan 430081, China 2 Northeastern University, Shenyang 110819, China * e-mail: sunmengneu@126 Received: 4 September 2021 Accepted: 16 November 2021 Abstract. Using ultra-fine wire saw to cut solar grade silicon wafer is a very precise technology. In the past 20 years, researchers have done ...

The image of a typical diamond wire-sawn silicon wafer is shown in Fig. 3. As shown in Fig. 3, the diamond wire-sawn silicon wafers display a shiny surface. The initial reflectance of the diamond wire-sawn wafers is typically higher than that of the slurry processing wafers [4]. The surface of diamond wire-sawn wafer bears remarkable parallel ...

Resin Bond Diamond Wire: Resin Coated: Uses resin to bond diamond particles to the steel wire, typically used for applications requiring high cutting smoothness. Classification by Application Fields. Photovoltaic Industry Diamond Wire: ...

GB/T 1303.5-2017 ?Industrial rigid laminated sheets based on thermosetting resins for electrical purposes--Part 5: Requirements for rigid laminated sheets based on melamine resins? ; GB/T 37195-2018 ?Technical specification for rehabilitation of pipeline corrosion prevention with resin? ; GB/T 11175-2021 ?Testing methods for synthetic resin emulsions?

Market Overview: The global diamond wire market is expected to grow at a CAGR of 6.5% during the forecast period from 2018 to 2030. The growth in the market can be attributed to the increasing demand for diamond wire in various applications, such as solar silicon cutting, LED sapphire cutting, and other applications.

The effect of cut depth and distribution for abrasives on wafer surface morphology in diamond wire sawing of PV polycrystalline silicon. Mater. Sci. Semicond. Process., 91 (2019), pp. 316-326. ... Subsurface crack damage in silicon wafers induced by resin bonded diamond wire sawing. Mater. Sci. Semicond. Process., 57 (2017), pp. 147-156. View ...

A diamond wire cutting and backing technology, which is applied in the field of special backing for photovoltaic diamond wire cutting, can solve the problems of difficult control of cells, increased ...

The electroplated diamond wire sawing technology is the mainstream processing method of cutting PV polycrystalline silicon ingots. Surface roughness is one of the most significant evaluation indexes for wafers surface quality, and has an important influence on subsequent processes such as surface texturization, screen printing, subsurface damage layer ...

As the photovoltaic industry needs to reduce manufacturing costs, the kerf loss and the wafer thickness of diamond wire slicing will be further reduced in the future, which will make the spacing ...

This study aimed to evaluate and better understand the mechanical and crystalline responses of polycrystalline silicon sawn by diamond wire sawing. To simplify the multi-wire sawing kinematic, an endless wire saw with a single looped diamond wire welded was used. The wire cutting speed and feed rate were varied in order to evaluate the characteristics of ...
