These advances have made solar photovoltaic technology a more viable option for renewable energy generation and energy storage.

Can energy storage systems reduce the cost and optimisation of photovoltaics?

The cost and optimisation of PV can be reduced with the integration of load management and energy storage systems. This review paper sets out the range of energy storage options for photovoltaics including both electrical and thermal energy storage systems.

What types of energy storage systems can be used for PV systems?

Among the many forms of energy storage systems utilised for both standalone and grid-connected PV systems, Compressed Air Energy Storage (CAES) is another viable storage option [93,94]. An example of this is demonstrated in the schematic in Fig. 10 which gives an example of a hybrid compressed air storage system. Fig. 10.

Should a photovoltaic system use a NaS battery storage system?

Toledo et al. (2010) found that a photovoltaic system with a NaS battery storage system enables economically viable connection to the energy grid. Having an extended life cycle NaS batteries have high efficiency in relation to other batteries, thus requiring a smaller space for installation.

What storage technologies can be combined with solar PV systems?

Apart from the above four storage technologies, there are many more that can be combined with solar PV systems to store excess capacity electricity, such as thermal energy storage (TES) systems, ultra batteries and supercapacitors, to name a few.

Over the past decade, global installed capacity of solar photovoltaic (PV) has dramatically increased as part of a shift from fossil fuels towards reliable, clean, efficient and sustainable fuels (Kousksou et al., 2014, Santoyo-Castelazo and Azapagic, 2014). PV technology integrated with energy storage is necessary to store excess PV power generated for later use ...
