

How to design a solar PV system?

When designing a PV system, location is the starting point. The amount of solar access received by the photovoltaic modules is crucial to the financial feasibility of any PV system. Latitude is a primary factor.

Why should you choose Atlas solar panels?

Atlas installs solar panels in half the time required for current fully manual methods. This reduces construction timelines while improving safety by minimising heavy lifting and creating better working conditions in harsh climates.

How can GIS Help A solar PV system?

GIS finds the suitable areas for solar PV panel installation. Layout design maximizes the energy production potential of a solar PV system. The new method has been applied to identify the optimal panel layout on a rooftop. Flexible panel alignments increase the maximal energy production by up to 6%.

What is Atlas & how does it work?

Atlas is a tool to assist the solar installation workforce; it automates the repetitive and manual steps of the solar panel installation process. Atlas installs solar panels in half the time required for current fully manual methods.

How 3D-printed solar panels work?

The 3D printer plays a pivotal role in the manufacturing process of 3D-printed solar panels. It uses a layer-by-layer approach to build the solar cells, resulting in highly efficient and tailored panels.

How 3D-printed solar panels benefit consumers?

The introduction of 3D-printed solar panels enriches the solar technologies available to consumers. It diversifies the options for individuals and industries looking to harness solar power. This diversification means that consumers have more choices and that solar technology can be tailored to meet specific energy output requirements.

$$N \text{ modules} = \text{Total size of the PV array (W)} / \text{Rating of selected panels in peak-watts.}$$
 Suppose, in our case the load is 3000 Wh/per day. To know the needed total W Peak of a solar panel capacity, we use PFG factor i.e.  
$$\text{Total W Peak of PV panel capacity} = 3000 / 3.2 \text{ (PFG)} = 931 \text{ W Peak.}$$
 Now, the required number of PV panels are =  $931 / 160\text{W} = 5.8$ .
