

A lithium-ion battery (LiB) is an electrochemical device consisting of four main components: a negative electrode or often called an anode, a positive electrode or often called a cathode, an electrolyte and a separator as shown in Fig. 1 [4], [23]. The main property of the electrolyte is to transport ions from the anode to the cathode or vice-versa while ensuring as ...

Thermal management systems for power batteries based on phase change materials (PCM) are limited by low heat transfer efficiency, leakage issues, and high rigidity, and most of them cannot meet the needs of all-climate thermal management. ... between the double-layer sleeve structure and the battery are measured to be only 0.15 °C W<sup>-1</sup> ...

Abstract. Thermal management is critical for safety, performance, and durability of lithium-ion batteries that are ubiquitous in consumer electronics, electric vehicles (EVs), aerospace, and grid-scale ...

EVs are gaining more attention due to increasing crude oil prices and significant prospects for reducing greenhouse gases (GHG) emissions. Lithium-ion batteries are favored for powering EVs due to their high power capacity and energy density, slower rate of self-discharge and lightweight, compared to all current power storage.

Lithium-ion batteries have been widely used as an energy source for electric cars, portable devices, etc. Since lithium-ion batteries are very sensitive to temperature, thermal management has become a crucial part of battery pack engineering design.
