How to reduce the energy loss of hydraulic press drive system?

By analyzing the energy dissipation characteristic of hydraulic press drive system which is composed of several motor-pumps used to provide energy, an energy-saving design method is developed to reduce the energy loss of the drive system.

How to reduce energy consumption of hydraulic press with multi motor-pumps?

Considering the energy consumption characteristics of the hydraulic press with the drive system consisting of multi motor-pumps, an energy-saving design method for the drive system was proposed to increase the matching degree between its output power and the demanded power of the load.

Does a rapid sheet tension hydraulic press save energy?

The energy-saving effect was validated through a 2000-ton rapid sheet tension hydraulic press whose energy consumption in all working stages was quantified. The results indicated that the energy consumption of the drive system in a working cycle had been reduced by 26.97%.

How much power does a servo press need?

A transformer with a minimum rated power of 2000 kVA is required. For a complete energy management, the drive system of the press example is expanded to include three kinematic energy storage devices with a maximum power of 1000 kW. As a consequence, it is possible to keep the alternating component of the power in the servo press drive system.

How does a hydraulic press slider recover energy?

In terms of the energy recovery, the kinetic energy or gravity potential energy of the hydraulic press slider, which will be released in the follow-up operation, is recovered and stored in an accumulator by using an energy regeneration system [6,7,8,9,10].

Does a servo press need energy management?

For a servo press without energy management, the mechanical power to be output by the motor - as well as the power loss of the electric system - must always be completely covered by the infeed and the line supply.
