What is absorption thermal energy storage?

5. Conclusion and perspectives Absorption thermal energy storage is promising for the storage of solar energy, waste heat and etc. Due to its superior properties including high energy storage density and small heat loss during long-term storage, the absorption thermal energy storage has been extensively studied in the last few years.

What is the role of working pair in absorption thermal energy storage?

Except for the thermodynamic and system integration aspects, working pair also plays an important role in the absorption thermal energy storage. Previously, different absorption materials have been used for absorption cycles including absorption heat pumps, absorption chillers, and absorption heat transformer.

Can absorption thermal energy storage be integrated with absorption heat pump?

In the Royal Institute of Technology, Sweden, integrated absorption thermal energy storage with absorption heat pump based on KOH-H<sub>2</sub>O theoretically studied, and energy storage density of 220 kWh/m<sup>3</sup> could be obtained. However, KOH is harmful and highly corrosive material which might hinder its implementation in real applications.

How does thermal energy storage work?

By far the most common way of thermal energy storage is as sensible heat. As fig.1.2 shows, heat transferred to the storage medium leads to a temperature increase of the storage medium. A sensor can detect this temperature increase and the heat stored is thus called sensible heat. Fig. 1.2.

What are the criteria for absorption thermal energy storage?

Some criteria for absorption thermal energy storage mentioned in the literature are , , , : High sorbate uptake between charging and discharging processes. Low charging temperature. High heat of absorption. Good compatibility with construction materials-non-corrosive materials.

What is an integrated absorption thermal storage system?

Integrated absorption thermal storage system with internal compressor and working pairs. The pair is stable at a temperature up to 160 °C, but it requires rectification. The viscosity is very high and the absorbate may decompose at 110 °C, but with the three steps an energy density of 180 kWh/kg could be achieved.

Sorption Mechanics of Sorbents. The definition of "sorption" is given before proposing the sorption material classification. According to the definition recommended by IUPAC (International Union of Pure and Applied Chemistry) [7, 8], adsorption refers to the enrichment or depletion of one or more components in an interfacial layer. The material capable of adsorbing ...
