Generally, SOH describes the health of a battery in terms of its ability to release coulombs. While energy efficiency describes the efficiency of a battery as an energy storage medium in terms of the ratio of energy transfer during charging and discharging. Further details on typical energy efficiency and SOH values can be found in Table 3.

NaS batteries are a relatively new technology, with some of the most promising options for high power energy storage applications. They have high energy density and efficiency, 140-300 kWh/m 3 and around 85%, respectively. NaS batteries do not self-discharge, require low maintenance and are 99% recyclable.

Energy storage is substantial in the progress of electric vehicles, big electrical energy storage applications for renewable energy, and portable electronic devices [8, 9]. The exploration of suitable active materials is one of the most important elements in the construction of high-efficiency and stable, environmentally friendly, and low-cost ...

Energy storage is crucial for solar energy utilisation. This chapter provides an introduction into different energy storage types and focuses on batteries, their operation and applications, battery technologies, characteristics and management.

In contrast, the ratio of power to energy is fixed for integrated cells at the time of design and manufacture of the cells. Economies of scale in cell production limit the practical number of different cell designs that are available. Hence, storage applications with integrated cells will usually have an excess of power or energy capability.
