Cold Storage Facilities Energy Savings Guide Oregon cold storage facilities face challenges of rising operating costs, rigorous product and safety standards, evolving environmental regulations and outdated

equipment and facilities. Throughout the state, cold storage facilities continuously look for ways to control costs.

As refrigeration equipment that can store frozen food and biological samples on a large scale [8], cold store is an important infrastructure for food freezing processing, ... PCMs can be utilized for energy storage by using a large amount of latent heat absorbed or released when the state of matter changes.

Cold thermal energy storage (CTES) based on phase change materials (PCMs) has shown great promise in numerous energy-related applications. Due to its high energy storage density, CTES is able to balance the existing energy supply and demand imbalance. Given the rapidly growing demand for cold energy, the storage of hot and cold energy is emerging as a ...

Phase change cold storage technology means that when the power load is low at night, that is, during a period of low electricity prices, the refrigeration system operates, stores cold energy in the phase change material, and releases the cold energy during the peak load period during the day [16, 17] effectively saves power costs and consumes surplus power.

Thermal energy storage is being used by several cooling operations. This equipment stores ice during the night and then uses it the following day for product cooling. Thermal energy storage is very cost effective if it is designed into the initial refrigeration system, creating a less expensive, small system that operates
