

What is a molecular solar thermal (MOST) system?

Here, we report a combination of solution- and neat-film-based molecular solar thermal (MOST) systems, where solar energy can be stored as chemical energy and released as heat, with microfabricated thermoelectric generators to produce electricity when solar radiation is not available.

Can a molecular thermal power generation system store and transfer solar power?

The generator can produce, as a proof of concept, a power output of up to 0.1 nW (power output per unit volume up to 1.3 W m^{-3}). Our results demonstrate that such a molecular thermal power generation system has a high potential to store and transfer solar power into electricity and is thus potentially independent of geographical restrictions.

What are thermal energy storage concepts for direct steam generation solar plants?

"Thermal energy storage concepts for direct steam generation (DSG) solar plants" summarizes recent research from the use of the existing commercial systems with optimized power blocks, to three-part storage systems that combine the use of sensible and latent heat storage.

What is a solar thermal power plant?

Since steam turbines can only be operated economically above a certain minimum size, today's solar thermal power plants have rated outputs in the range of 50 to 200 megawatts. The main difference to a conventional steam power plant is the solar field, which supplies the heat for the steam generator.

How is solar thermal electricity generated in a CSP plant?

Solar thermal electricity in a CSP plant is generated in two stages. In the first stage, solar energy is captured in the collectors and is used to heat a working fluid which may be water or molten salt. The second stage deals with the energy transformation in which electricity is generated by allowing steam to run a turbine or an engine.

What is solar thermal processing?

"Solar thermal processing" provides an overview of applications other than electricity generation, with focus on solar fuels and solar material processing and production. At present these high-temperature direct solar thermal processing applications have progressed to the proof of concept.

Photovoltaics (PV) and wind are the most renewable energy technologies utilized to convert both solar energy and wind into electricity for several applications such as residential [8, 9], greenhouse buildings [10], agriculture [11], and water desalination [12]. However, these energy sources are variable, which leads to huge intermittence and fluctuation in power ...

The trade-off between solar multiple and thermal storage capacity is crucial in achieving cost-effective power generation in CSP plants. The solar multiple expresses the ratio between the thermal energy captured by the solar field and that required to operate the power cycle at a nominal load [69]. Therefore, a solar multiple higher than one ...
