

# Summary of vanadium energy storage projects

How will PV & vanadium flow work together?

The Project will co-locate PV (solar electricity panels) and Vanadium Flow battery storage behind a single network connection to optimise the capital costs associated with deploying the two projects independently and improve the efficiency of creating dispatchable and firm solar power.

Could a vanadium redox flow battery solve storage problems?

A type of battery invented by an Australian professor in the 1980s has been growing in prominence, and is now being touted as part of the solution to this storage problem. Called a vanadium redox flow battery (VRFB), it's cheaper, safer and longer-lasting than lithium-ion cells.

What is a vanadium flow battery?

The vanadium flow battery will take advantage of the significant intraday price variation in South Australia to time shift power from midday to peak periods in the evenings and mornings. The Project will also participate in the Frequency Control Ancillary Services (FCAS) market which helps maintain stability of the electricity system.

Are vanadium flow batteries a Multi-Mega Watt energy solution?

In the words of Barack Obama "They are the multi-mega watt energy solution" and "one of the coolest things" he has ever spoken about. Vanadium flow batteries have significant advantages over lithium in longer duration time shifting applications.

Are vanadium flow batteries flammable?

Vanadium flow batteries are fully containerised, non-flammable units reusable over semi-infinite cycles, able to discharge 100% of the stored energy and do not degrade. In the words of Barack Obama "They are the multi-mega watt energy solution" and "one of the coolest things" he has ever spoken about.

Are vanadium flow batteries better than lithium?

Vanadium flow batteries have significant advantages over lithium in longer duration time shifting applications. The batteries will be able to discharge at a power of 2MW per hour for four hours. They are suitable for heavy cycling because, unlike lithium, they do not degrade.

The expense of building a vanadium-based energy storage project is significantly more than the cost of building a lithium-based project, posing the foremost challenge for vanadium battery projects. "Building a vanadium battery costs around 3,000-4,000 yuan per kWh, while building a lithium battery costs about 1,500 yuan per kWh," a battery ...
