Is energy storage device testing the same as battery testing?

Energy storage device testing is not the sameas battery testing. There are, in fact, several devices that are able to convert chemical energy into electrical energy and store that energy, making it available when required.

What is a battery energy storage system?

Battery Energy Storage Systems (BESS) are expected to be an integral component of future electric grid solutions. Testing is needed to verify that new BESS products comply with grid standards while delivering the performance expected for utility applications.

How do you test a battery for utility applications?

An important aspect of testing batteries for utility applications is to test with cycle patterns that correspond to defined market applications, such as those shown in Table 3. Typically battery manufacturers only run life cycle tests at 100% or 80% of energy capacity.

What is energy storage performance testing?

Performance testing is a critical component of safe and reliable deployment of energy storage systems on the electric power grid. Specific performance tests can be applied to individual battery cells or to integrated energy storage systems.

What chemistries can you test a battery with?

We are able to test primary and secondary (rechargeable) batteries with chemistries including alkaline,lithium-ion (Li-ion),nickel metal hydride (NiMH),lead acid,and nickel-cadmium (NiCd)as well as newer technologies such as zinc-based and flow batteries.

Are there standards for integrated battery energy storage systems?

There are standards for photovoltaic system components, wind generation and conventional batteries. However, there are currently no IEEE, UL or IEC standards that yet pertain specifically to this new generation of integrated battery energy storage system products. The framework presented below includes a field commissioning component.
