

# The voltage of photovoltaic panel power generation is unstable

Does a large-scale photovoltaic system have dynamic stability?

This study investigates and reports on the dynamic stability of the power system with a large-scale photovoltaic system (L-S PV). Two different scenarios with centralised PV power plants are considered in the medium voltage level without voltage regulation capabilities.

Does voltage instability decrease with a centralised PV power plant?

Two different scenarios with centralised PV power plants are considered in the medium voltage level without voltage regulation capabilities. Simulation results with these scenarios will show how the voltage instability decreases with the L-S PV based on the bus status, disturbance location, and disturbance duration.

Can a photovoltaic system boost power requirements?

Dynamic and static are two approaches mentioned in the literature for investigating voltage stability of grids. The dynamic analysis techniques were used in 5,6 to confirm that the photovoltaic system can boost the system's power requirements.

Does large-scale solar-PV generation affect long-term voltage stability?

This paper investigated the impact of large-scale solar-PV generation on long-term voltage stability. A rigorous theoretical analysis was performed with a simple test system to compare the LTVS impact of the solar-PV generation with the SG. Then the Nordic test system was used to conduct a system wide LTVS study with solar-PV generation.

Is power system voltage stability possible?

Perfect power system voltage stability is not possible in practice. Generally, the power grid is continually exposed to changes in its load and operating conditions. Therefore, dynamic stability an...

Do solar-PV systems improve voltage stability?

It can be observed that solar-PV systems improve the voltage stability by enabling more reactive power reserve ( $Q_s - Q_L = 615 \text{ MVar}$ ) which improves the stability margin ( $(V_o - V_{cr})/V_o = 39\%$ ) of the system in comparison to SGs. Fig. 25 illustrates the reactive power output at the PCC and the terminal voltage of solar-PV systems and SGs.

In the past decade, a rapid increase in solar Photovoltaic (PV) capacity is observed at a global level [1] the end of 2020, the installed capacity was estimated at 714 GWp [2]. Moreover, with an added annual capacity of 127 GWp, solar PV was the quickest growing renewable power generation technology in 2020 [2]. Due to further decreasing costs, it ...

Research Article Fast Assessment Method for Transient Voltage Stability of Photovoltaic Receiving-End Grid

# The voltage of photovoltaic panel power generation is unstable

Ying Qu,<sup>1</sup> Xiaoqing Han,<sup>2</sup> Tao Meng,<sup>3</sup> Xinyuan Liu,<sup>1</sup> Danyang Chen,<sup>1</sup> and Zhewen Niu <sup>2</sup> <sup>1</sup>State Grid Shanxi Electric Power Research Institute, Taiyuan 030001, China <sup>2</sup>College of Electrical and Power Engineering, Taiyuan University of Technology, Taiyuan ...

1. Introduction 1.1 Background. Interest in photovoltaic (PV) power generation has increased recently due to environmental problems such as greenhouse gas emissions, and a high level of penetration of PV into the power system is expected in the future 1, 2. PV generation is different in a number of ways from thermal power generation and other conventional ...

Evaluation of dynamic interactions for power systems with reduced synchronous generation, i.e. high integration of PV generation with power electronics components. In the literature, PVPP integration in standard IEEE models with SG components is considered [4], [5], [8], [12], [14], but only in Liu et al. [12] an eventual replacement of the SGs by PVPPs is ...

The LVRT capability plays its role to sustain the operation of solar power generation without sudden tripping of solar generation to the grid during transient conditions. Eventually this evades the sudden loss of power during transient conditions and also support the grid by providing reactive power (Maha et al., 2018; Mehrdad and Tohid, 2018).

Matlab and Simulink can simulate the effects on PV panel power by utilizing catalog data from PV panels as well as temperature and solar radiation information. (Al-Sheikh, 2022; Karafil et al ...

In this study, Solar Photovoltaic (PV) Generation systems that are one of the Renewable Distributed Generation (RDG) systems are integrated into the IEEE 30 bus test system. The ...

The high penetration level of solar photovoltaic (SPV) generation systems imposes a major challenge to the secure operation of power systems. SPV generation systems are connected to the power grid ...

Output power disturbance of the PV array and grid disturbance will affect the point of common coupling (PCC) voltage and make it unstable. An unstable PCC voltage subsequently affects the dynamics of the VSC control ...

The results of the bus voltage of the PV and the bus voltage angle of the weakest bus are shown in Figs. 8a and b. Figs. 8c and d show variations of the electrical power and terminal current of the generators (G1, G2). It is clearly noticed that when the generator (G2) is down, (G1) loses its stability, but the transient stability is recovered ...

The performance of solar panels greatly determines the electrical energy production of a solar power generation system. The decrease in performance has an impact on efficiency, output power ...

# The voltage of photovoltaic panel power generation is unstable

The parameters of each PV panel are as follows: the open-circuit voltage is 50 V, the voltage at the maximum power point is 42 V, and the maximum power output is 480 W. The PV1 array consists of three strings of PV panels, while the PV2 array consists of six strings of PV panels. And each string contains eight panels connected in series.

The local use of solar power generation leads to a more unstable demand power curve with limited possibilities to forecast it. Short-term solar forecast based on cloud imaging (Golden and Paulos 2015 ) can be used in a system that covers the entire urban area and can therefore more reliably forecast short-term solar irradiance dips and thus a correlating ...

Within the background of realizing clean and sustainable development, as well as deepening energy conservation and greenhouse gas emission reduction worldwide, the use of wind and solar energy to generate electricity and replace fossil-based power has become a global energy development trend [1, 2]. Over 200 GW of renewable power capacity was added in ...

In this paper, artificial neural network (ANN) and adaptive neuro-fuzzy inference system (ANFIS) are used as maximum power point tracking controllers to improve the performance of a stand-alone photovoltaic system. Based on the FL-M-160W PV module specifications, the PV panel and the boost converter were modeled in MATLAB/Simulink ...

Two different scenarios with centralised PV power plants are considered in the medium voltage level without voltage regulation capabilities. Simulation results with these scenarios will show how the voltage instability ...
