The multi-junction approach to stacking thin-film perovskite captures more of the light spectrum, increasing the amount of solar electricity that can be generated. Credit: Oxford University Physics.

The internet of things revolution requires efficient, easy-to-integrate energy harvesting. Here, we report indoor power generation by flexible perovskite solar cells (PSCs) manufactured on roll-to-roll indium-doped tin oxide (ITO)-coated ultra-thin flexible glass (FG) substrates with notable transmittance ($>80\%$), sheet resistance ($13 \Omega/\text{square}$), and bendability, ...

Scientists at Oxford University Physics Department have developed a revolutionary approach which could generate increasing amounts of solar electricity without the need for silicon-based solar panels. Instead, their innovation works by coating a new power-generating material onto the surfaces of everyday objects such as rucksacks, cars, and mobile ...

The light-absorbing material is thin and flexible enough to apply to the surface of almost any building or common object. Oxford's technique, which stacks multiple light-absorbing layers into one solar cell, will be utilized to connect a wider range of the light spectrum, allowing more power to be generated from the same amount of sunlight.

The fs laser generates a train of repetitive ultra-short light pulses, high peak power with low average power (e.g., 100 fs pulse duration, 1 MW peak power, and 10 mW average power at 100 kHz ...

Thin film solar cells shared some common origins with crystalline Si for space power in the 1950s [1]. However, it was not until 1973 with the onset of the oil embargo and resulting world focus on terrestrial solar energy as a priority that serious research investments in these PV technologies were realized [2, 3]. The race to develop electric-power alternatives to ...
