What is the difference between carbonate and ether based electrolytes?

Ether-based electrolytes, commonly used in Li-S batteries, are highly volatile and impractical for many applications. On the other hand, carbonate-based electrolytes have been used in commercial Li-ion batteries for three decades and are a natural and practical choice to replace ether-based electrolytes in Li-S batteries.

Can carbonate-based electrolytes be used to commercialize Li-S batteries?

Strategies enabling SSDC reaction in carbonate electrolytes Despite the differences in electrochemical behavior, and advantages of carbonate-based electrolytes, there is no review paper on the use of carbonate-based electrolytes as a viable option in the commercialization of Li-S batteries.

Are carbonate based electrolytes used in Li-ion batteries?

Carbonate-based electrolytes have been widely used in Li-ion battery industry for three decades . Moreover, several additives (such as flame-retardant additives) have been already investigated and applied in carbonate-based electrolytes used in commercial Li-ion batteries .

Are bulk solid-state batteries the future of energy storage?

While still premature as an energy storage technology, bulk solid-state batteries are attracting much attention in the academic and industrial communities lately. In particular, layered lithium metal oxides and lithium thiophosphates hold promise as cathode materials and superionic solid electrolytes, respectively.

Can carbonate-based electrolytes be used in sulfur batteries?

In this regard, we have introduced the "solid-solid direct conversion reaction" (SSDC) of sulfur as key to successfully use carbonate-based electrolytes in sulfur batteries.

High-temperature Thermal Energy Storage (TES) systems have undergone great synergistic development together with Concentrating Solar Power (CSP) plants, although the potential of TES includes integration with other types of technologies, such as Pumped Thermal Energy Storage (PTES) or even their integration to store electrical energy.

Since the commercialization of Li-ion batteries (LIBs), electrolytes have been playing a crucial role in enhancing battery performance. The introduction of ethylene carbonate (EC) into traditional polypropylene
