Can a permanent magnet generator be used in a wind turbine?

Generator systems commonly used in wind turbines, the permanent magnet generator types, and control methods are reviewed in the paper. The current commercial PMG wind turbine on market is surveyed. The design of a 5 MW axial flux permanent magnet (AFPM) generator for large wind turbines is discussed and presented in detail.

Why do wind farms need permanent magnet synchronous generators (PMSG)?

Because of the difficult access to the offshore facilities, the reduction of maintenance is an essential point. The use of Permanent Magnet Synchronous Generators (PMSG) is considered a suitable option in this wind farm topology to satisfy this purpose.

What is a permanent magnet synchronous generator (PMSG)?

The use of Permanent Magnet Synchronous Generators (PMSG) is considered a suitable option in this wind farm topology to satisfy this purpose. On the other hand, these generators along with full-rated Voltage Source Converters (VSC) are expected to provide ancillary services for the onshore AC grid.

What is a direct drive permanent magnet generator?

Direct drive permanent magnet generators (PMGs) are increasingly capturing the global wind market in large onshore and offshore applications. The aim of this paper is to provide a quick overview of permanent magnet generator design and related control issues for large wind turbines.

Can magnets be used to remove mechanical gearboxes from wind turbines?

The ability of magnets to allow designers to remove mechanical gearboxes from wind turbines is illustrative of how magnets can be used innovatively in solving both operational and economic problems in modern wind turbines. constraints in modern wind turbines.

How to choose a wind turbine generator?

Among others is the design of the wind turbine generator. The desired generator should be small and light weight but such design always leads to a tradeoff in the output power aspect. Permanent Magnet Synchronous Generator (PMSG) and Doubly Fed Induction Generator (DFIG) are most commonly used in wind turbine.

Various topologies for high-power DD generators, such as a permanent magnet (PM) synchronous generator (PMSG), 5, 7 an electrically excited synchronous generator (EESG), 9 and a doubly fed induction generator (DFIG), 10 are researched. Among these, the DD-PMSG stands out as a representative topology.

Permanent magnet generators are widely adopted by the wind power industry. Because there are no wearing parts, PMGs ensure low failure rates and require less maintenance. The use of permanent magnets requires no external power source to initiate a magnetic field. This reduces costs, simplifies the structure and improves system efficiency.
